

Every legacy SAP program needs a Clean Core review before 2027.

Clean Core Copilot is an IBM Bob mode that does the first pass, and measures how far to trust it.

31.12.2027

SAP ends mainstream maintenance for ECC 6.0. Companies carry hundreds of custom ABAP programs that break the cloud rules. Each one is reviewed **by hand**, by the few people who know both worlds.

A project manager's question is not “can AI do this?” but “**how well, measured, and where does it fail?**”

A Bob custom mode that reviews old SAP code, and knows what it must not claim.

1 • Bob reads

A 12-rule Clean Core catalogue and the program. Read and edit tools only, no system access.

2 • Bob reports

Every finding with a line range, one rule ID and a reason. Nothing outside the catalogue is invented.

3 • Bob rewrites

A data view, a class and unit tests. Every unverified SAP name is marked *candidate*.

4 • Your system decides

Activation, ATC and tests run on SAP. Bob never claims this step happened.

Mode “Clean Core Architect”: role, 9 custom instructions, rule catalogue and verification rules, all in the public repo.

4

old-style programs

Supplier invoices, sales orders, material prices, material list. Synthetic, written for this test.

41

planted problems

29 break a written Clean Core rule. 12 are business-logic mistakes no rule list covers.

24 Sep

answer key sealed

SHA-256 committed before Bob saw any code. Nothing could be adjusted afterwards.

27/29

rule problems found

On the right lines, citing the right rule.

1/12

logic bugs found

A person still has to check the business logic. Now we know where.

29/32

findings correct

91 % of the findings we could judge. Two wrong, one partly right.

0 of 40 findings invented a rule.

0 of 40 claimed a check on a system it had not seen.

8/8

ABAP Unit tests passed

On an SAP BTP trial. Bob's 7 tests plus our check against the old code on 431 cases.

2 failed

when we planted a bug

One limit changed from 30 to 31 days. The tests really guard the logic.

0

ATC errors

The compiler found two syntax slips in Bob's code that reading did not. Logic errors: none.

The trial lacks two SAP data sources, exactly the ones Bob had marked *candidate*. Two small stand-in tables replaced them: the logic is tested, the link to real SAP data is not.

Custom mode “Clean Core Architect”: strict rules, Read + Edit only, no Execute, Browser or MCP.

7 Bob tasks: 4 audits, 1 rewrite, 1 fix after review, 1 parallel run. Every task summary is in bob_sessions/.

Parallel sub-agents: three programs, three sub-agents, 13 files in 16 minutes.

Asked before every write; for the treasury hand-off it wrote four options and left the choice to a person.

4.258 of 40 Bobcoin for the whole project.

A strong first reviewer for Clean Core rules.

A weak one for business logic.

The human stays in the loop, and now we know where.

Try it: copy the mode and the catalogue into your Bob workspace, open a legacy .abap file, send one prompt. Browse every finding next to the code on the evidence site.
